Eng Sub Exo Showtime Ep 9 Hd Video Dailymotion, Lounge Lizard Ep 4 Serial Number Macpacker Conexant Cx20468 Intel_Q, multi set of paramaters in a method I want to create a method which takes in a set of parameters that have their type vary and return the sum of their values (each of the paramters is a complex object). The only constraints I have on this method is that each value is a double. I tried to make a method like this: static TResult Calculate(TArg arg1, TArg arg2) where TArg : IComparable { if (!typeof(TArg).IsPrimitive) throw new ArgumentException("All arguments must be double."); return (TArg)arg1 + (TArg)arg2; } but it's a compile error. Cannot convert lambda expression to intended delegate type any help? A: I'd make it explicit: static TResult Calculate(TArg arg1, TArg arg2) where TArg : IComparable { if (!typeof(TArg).IsPrimitive) throw new ArgumentException("All arguments must be double."); return (TArg)arg1 + (TArg)arg2; }
